

Recycling

Recycling is the process of taking old waste materials and turning them into new products. Recycling is important because it helps reduce air and water pollutants in the environment, and saves on energy usage. There are many items that can be considered recyclable items including, but not limited to: glass bottles or jars, scrap metals, shingles, plastic products, cardboard, etc...

Recycling can also offer some return on investment for consumers. Consumers can take clean aluminum cans or glass bottles to any recycling center for a cash exchange. The same goes for any type of scrap metal (copper, steel, tin, etc...).

Here at A-Line Roll Off we believe it is important to encourage good recycling habits, as it is crucial in saving the environment from pollutants. We support all LEED (Leadership in Energy and Environment Design) construction projects, which encourages waste reduction and the reuse of recycled materials. We feel it is important to take care of our environment so that it can continue to thrive!
